Project 2 - Auth0 Implementation

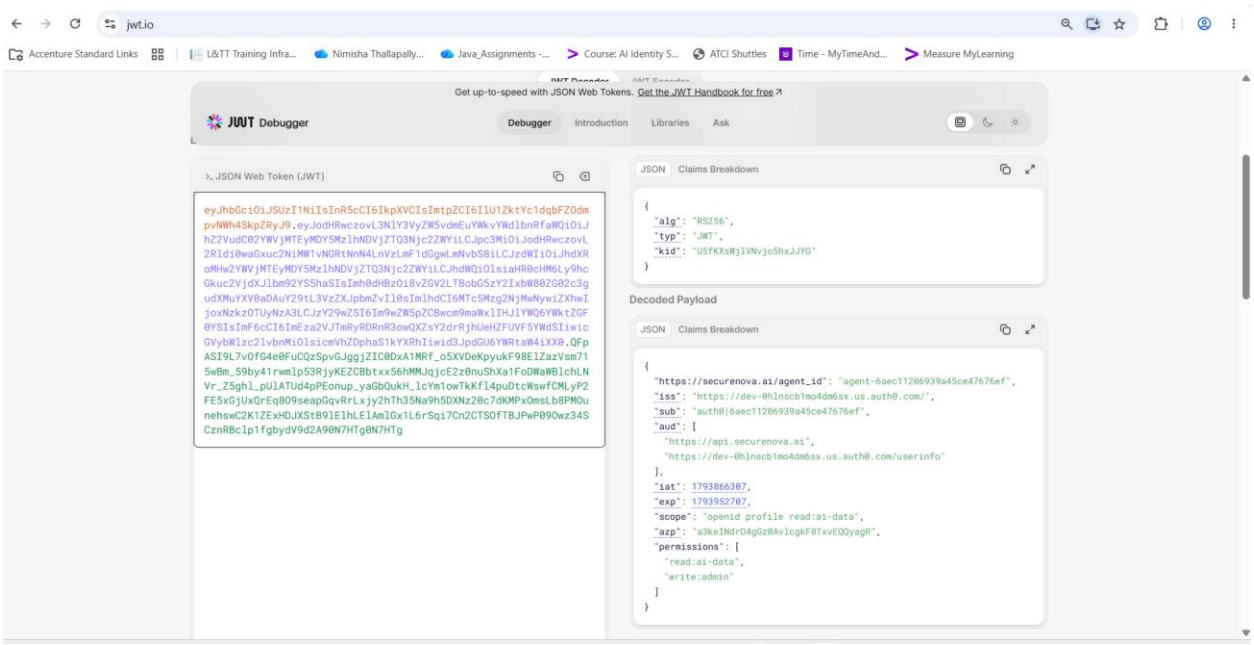

1. Auth0 Applications page - SecureNova Chat Web (Regular Web Application) and SecureNova AI Agent (Machine to Machine) both registered and visible.

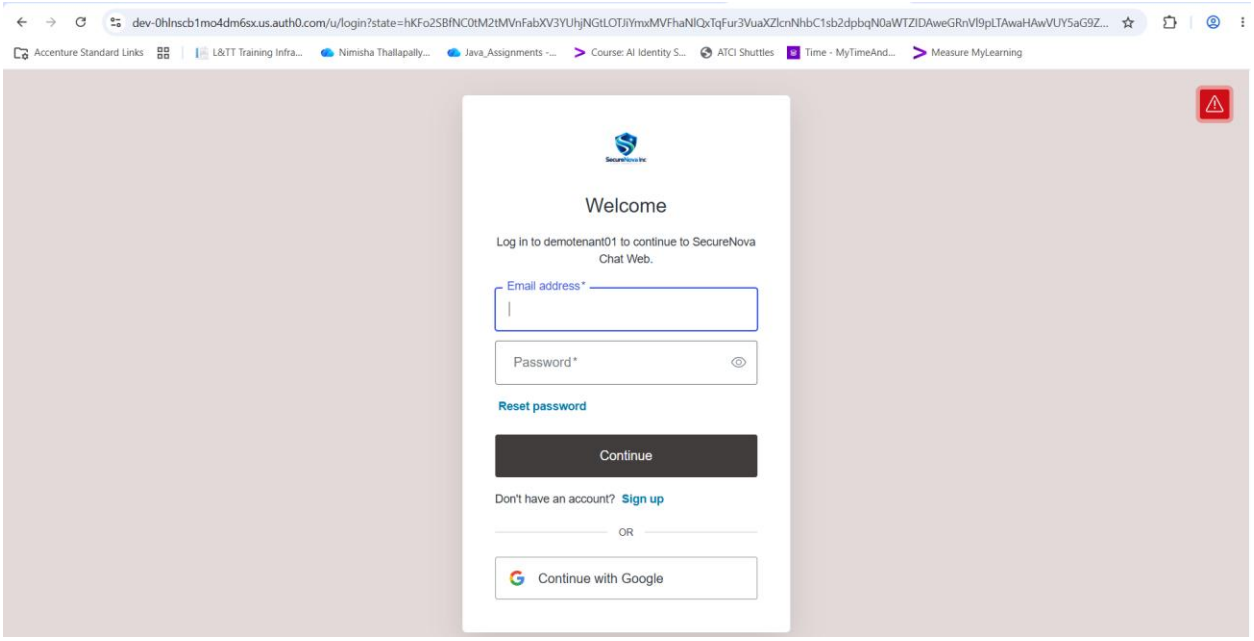

2. Auth0 APIs page - SecureNova API's Permissions tab showing the two custom scopes: read:ai-data and write:admin.

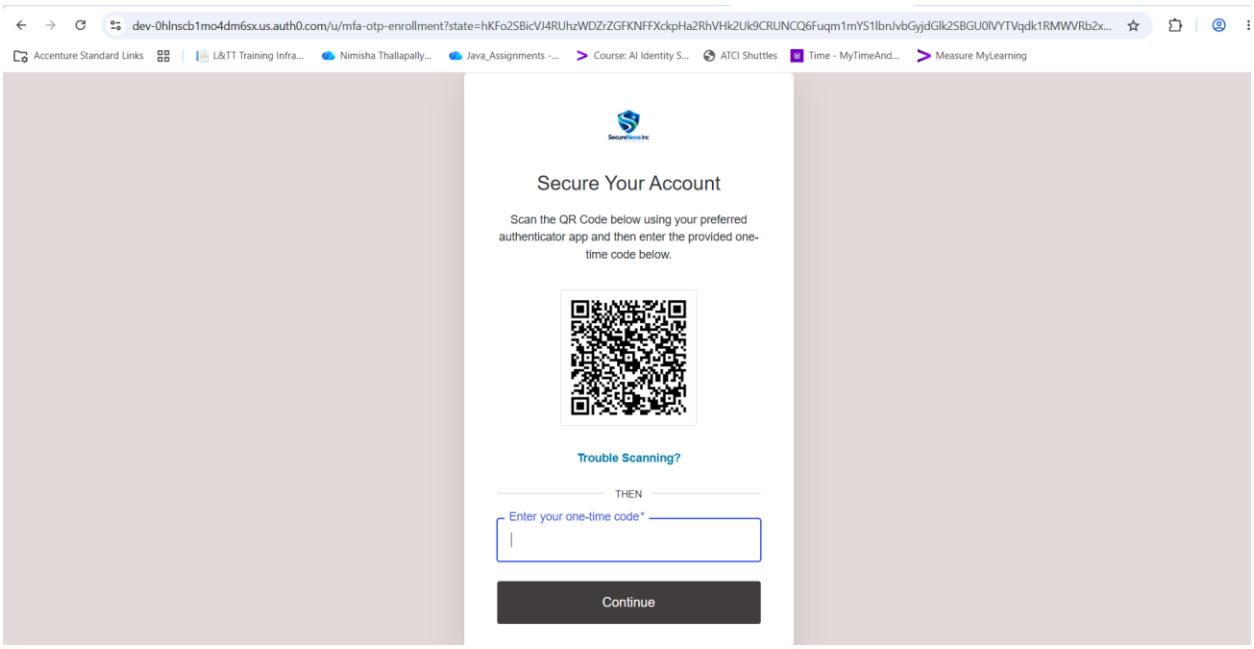

3. jwt.io - decoded access token from the PKCE login, showing aud, iss, exp, scope, and the custom agent_id claim.

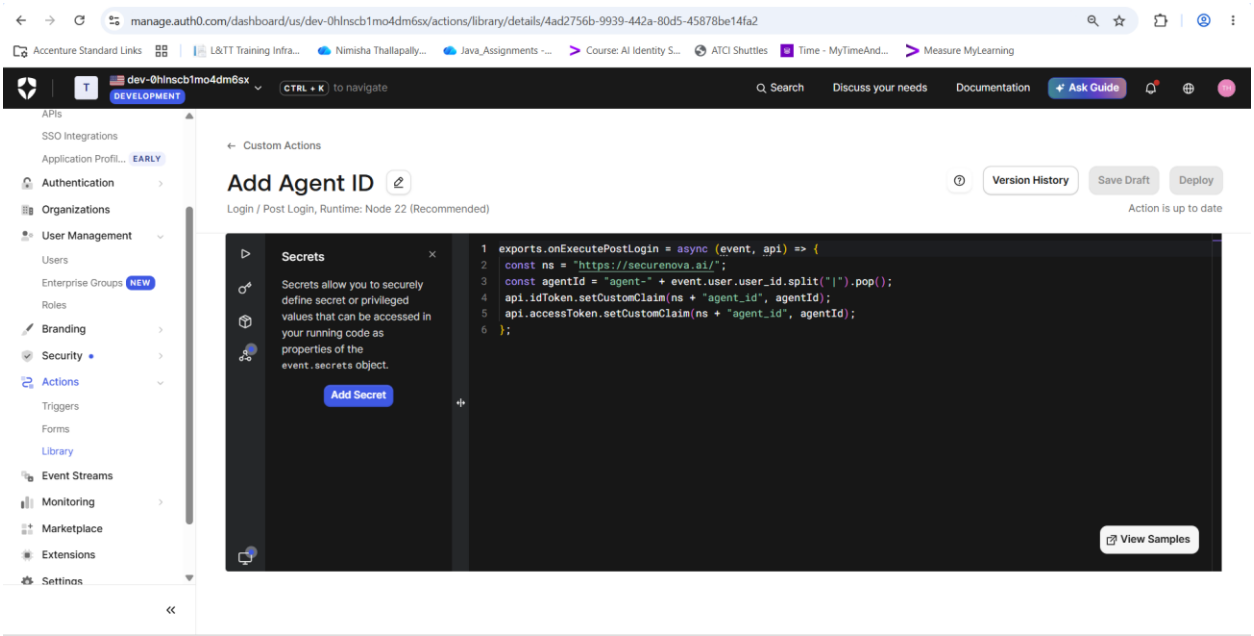

4. Auth0 Universal Login page in browser, showing custom branding applied.

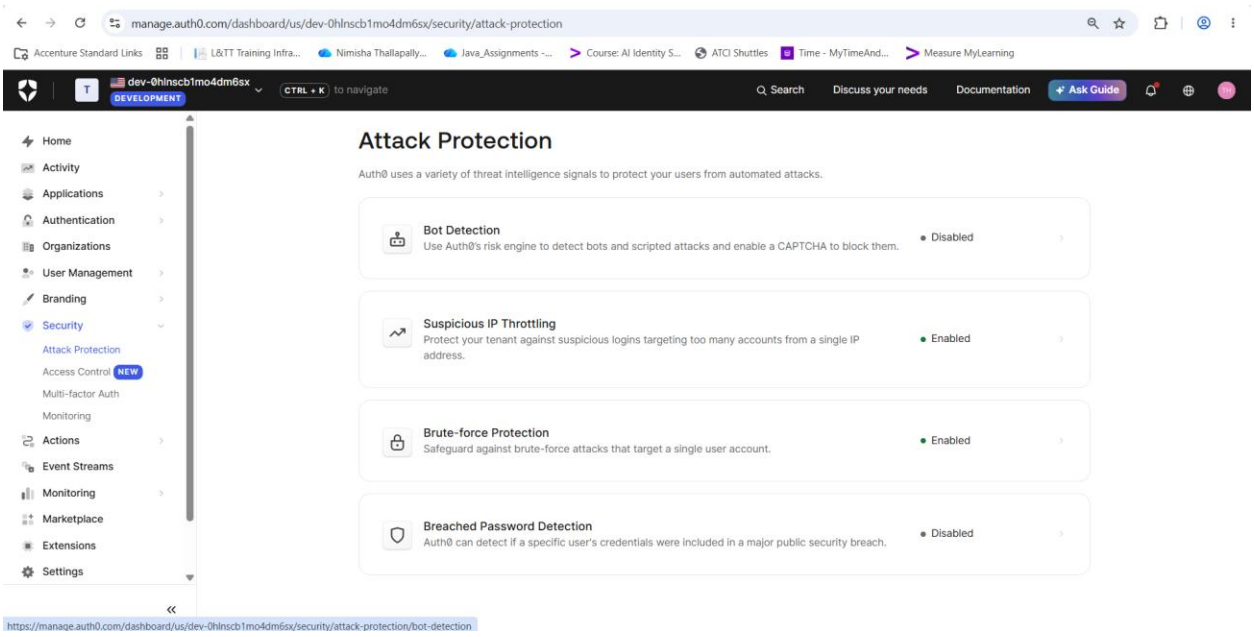

5. Auth0 MFA enrolment screen (TOTP QR code) and challenge prompt for admin1@test.com.

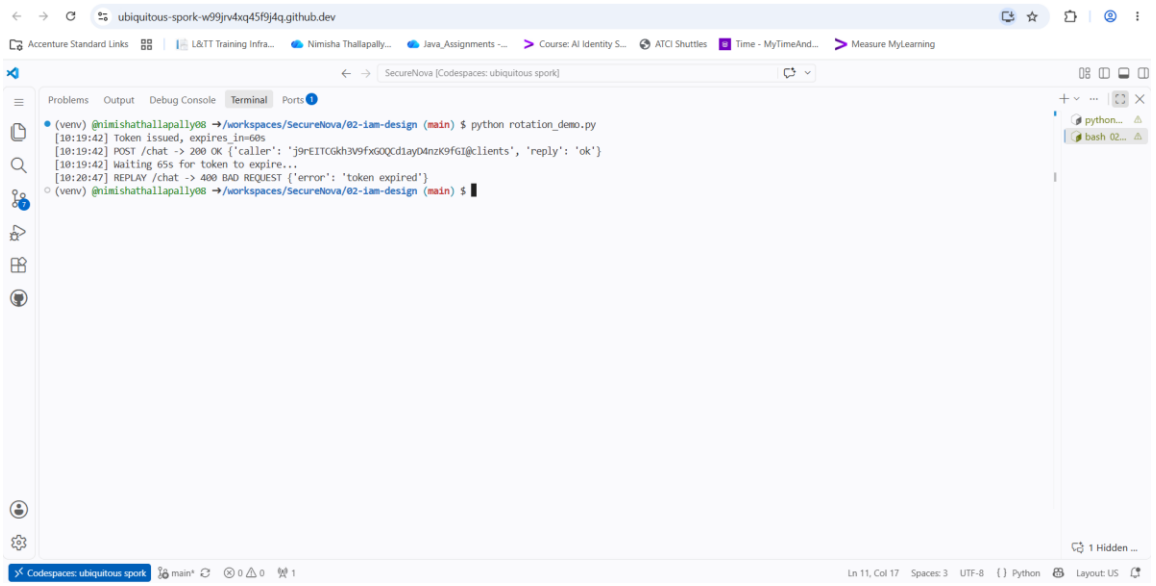

6. Auth0 Actions editor - post-login Action code adding the agent_id custom claim to the ID and access tokens.

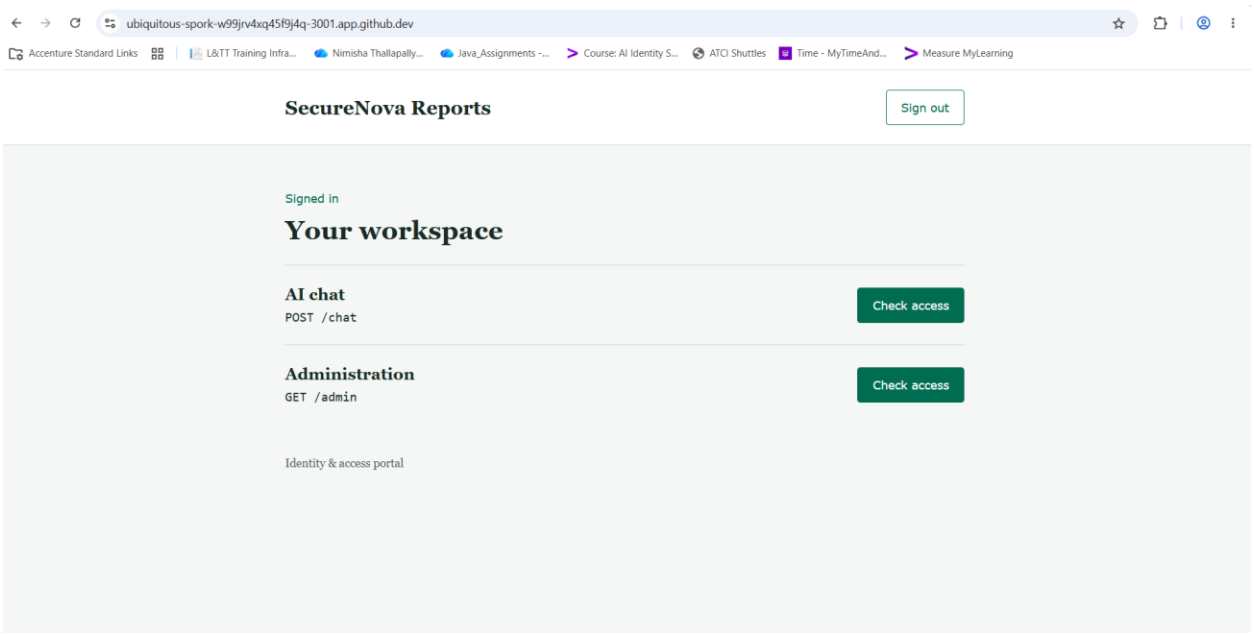

7. Auth0 Attack Protection panel - Brute-Force Protection and Suspicious IP Throttling both enabled.

8. Terminal - credential rotation script showing a timestamped 200 OK on /chat, followed by a 401 Unauthorized on replay after the 60-second token expiry.

9. Browser address bar - a second /authorize request to the same client completing without a re-prompt for login, demonstrating SSO session reuse.
